

PHISHING URL INVESTIGATION REPORT

Prepared By: Komati Damarika Sneha Latha Sree

Date: 28 May 2026 | 14:20 UTC

Tools Used:

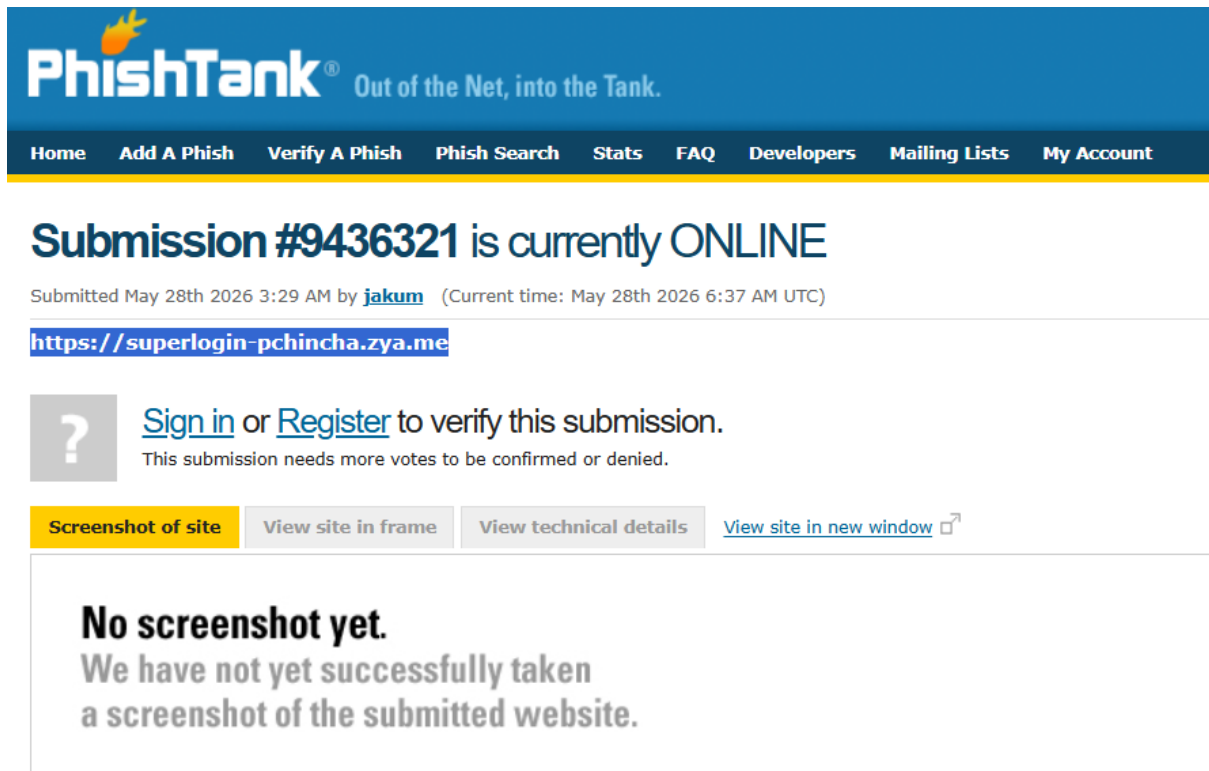

- PhishTank
- VirusTotal
- URLscan.io

Project Title: Phishing URL Analysis and IOC Investigation

1. Email Summary

The investigation analyzed a suspected phishing URL obtained from PhishTank. The URL impersonated a login-related service using the suspicious domain “superlogin-pchinchazya.me”. VirusTotal analysis identified the URL as malicious, with 18 out of 92 security vendors flagging it for phishing and fraud-related activity.

Further analysis using URLscan.io revealed that the phishing infrastructure redirected users to a suspended-domain page, indicating that the hosting provider likely disabled the malicious content. The investigation also identified suspicious network activity, multiple associated IP addresses, and phishing-related indicators commonly associated with credential harvesting attacks.

2. VirusTotal Analysis

The suspicious URL was analyzed using VirusTotal to determine its reputation and threat classification. The analysis showed that 18 out of 92 security vendors flagged the URL as malicious or phishing-related. Several security engines categorized the domain as phishing, fraud, and credential harvesting infrastructure.

The domain “superlogin-pchinchazya.me” displayed suspicious naming characteristics commonly associated with fake login portals and phishing campaigns. The detection results confirmed that the URL posed a significant security risk to users and could potentially be used to steal sensitive credentials or personal information.

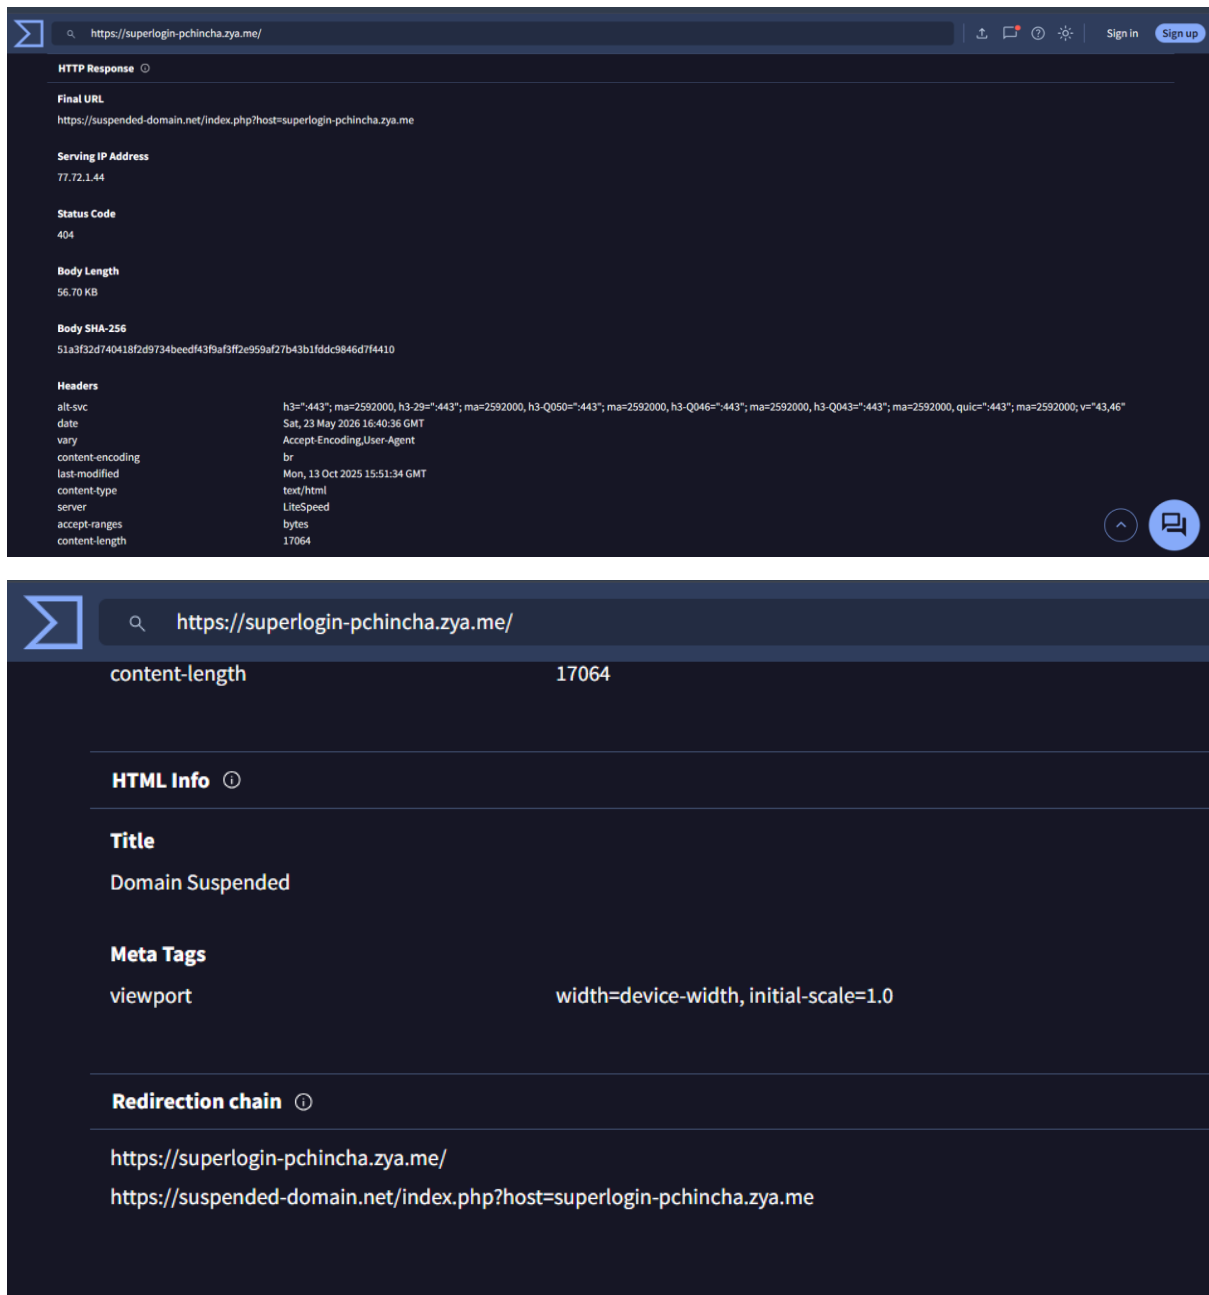

Figure 4: Details of the URL

3. URLscan.io Analysis

The phishing URL was further analyzed using URLscan.io to investigate infrastructure behavior, redirects, and associated network activity. The analysis revealed that the domain redirected users to a suspended-domain page, indicating that the hosting provider had likely disabled the phishing infrastructure due to malicious activity.

URLscan.io identified communication with multiple IP addresses and domains across different countries. The scan also revealed several HTTP transactions and infrastructure components associated with the phishing URL. Hosting and network analysis showed involvement of Cloudflare and KRYSTAL Hosting Ltd, which were associated with the observed network activity during the investigation.

4. Domain Analysis

The investigated phishing infrastructure utilized a suspicious domain name designed to imitate a legitimate login-related service. The domain “superlogin-pchincha.zya.me” used login-oriented terminology commonly associated with credential harvesting attacks and phishing campaigns.

Analysis of the domain structure revealed abnormal naming conventions and the use of a non-standard hosting domain, which are common indicators of phishing infrastructure. URLscan.io investigation also identified redirect behaviour to a suspended-domain page, suggesting that the hosting provider had disabled the malicious content after detection or abuse reporting.

The investigation further identified infrastructure associated with Cloudflare and KRYSTAL Hosting Ltd during network communication analysis.

5. Indicators of Compromise (IOCs)

This investigation identified several Indicators of Compromise (IOCs) associated with the phishing infrastructure. These indicators can be used by security teams to detect, block, and monitor similar phishing activity within organizational environments.

Malicious URL

- hxxps://superlogin-pchinchazya.me/

Redirected Domain

- suspended-domain.net

Associated IP Addresses

- 185.27.134.33
- 77.72.1.44
- 104.26.2.143
- 104.17.24.14

Hosting / Infrastructure

- Cloudflare
- KRYSTAL Hosting Ltd

Threat Indicators Identified:

- Phishing login infrastructure
- Suspicious redirect behavior
- Credential harvesting indicators
- Malicious domain activity

6. Risk Assessment

Risk Level: HIGH

The investigated URL demonstrated multiple indicators commonly associated with phishing and credential harvesting attacks. VirusTotal analysis identified numerous malicious detections from security vendors, while URLscan.io analysis revealed suspicious redirect behavior and infrastructure activity.

The phishing domain utilized deceptive naming conventions intended to imitate a legitimate login service. The observed behavior posed a significant risk to users by potentially facilitating credential theft, unauthorized access, and exposure of sensitive information.

7. Recommendations

- Block identified malicious domains and associated IP addresses at the network perimeter.
- Educate users about phishing attacks, suspicious login pages, and deceptive URLs.
- Enable Multi-Factor Authentication (MFA) to reduce the risk of credential compromise.

- Verify suspicious links using threat intelligence tools such as VirusTotal and URLscan.io before accessing unknown websites.
- Implement email filtering and web security controls to detect and block phishing-related activity.
- Monitor network traffic for communication with known malicious domains and phishing infrastructure.

8. Conclusion

This phishing investigation successfully identified malicious infrastructure, suspicious redirect behavior, and multiple indicators of compromise associated with a phishing campaign. Threat intelligence analysis using VirusTotal and URLscan.io confirmed the malicious nature of the investigated domain and revealed evidence consistent with credential harvesting activity.

This investigation demonstrated the practical use of phishing analysis techniques, IOC extraction, infrastructure investigation, and threat intelligence tools commonly used in Security Operations Center (SOC) environments.
